🎯 PROJET IA :

Section 4.1 - Prétraitement ✅

•Nettoyage, normalisation, anonymisation PII
•Fichier `preprocess.py` fonctionnel

Section 4.2 - Baselines ✅

•TF-IDF + SVM/Logistic Regression
•Validation croisée 5-folds
•Comparaison des performances

Section 4.3 - Transformers ✅

•DistilBERT et CamemBERT implémentés
•HPO (learning rate, batch size, epochs)
•Comparaison avec baseline

Section 4.5 - Interprétabilité ✅

•LIME pour explications locales
•Visualisation des features importantes

Section 5 - Évaluation ✅

•F1-macro, F1 par classe, matrices de confusion
•Calibration (temperature scaling)
•Seuil de rejet sur incertitude

Section 8 - API FastAPI ✅

•Endpoints `/health` et `/predict`
•Documentation interactive

Section 9 - Éthique & Données ✅

•Anonymisation PII
•Model Card
•Gestion des biais

🚀 COMMANDE POUR INSTALLER TORCH CPU :

bash

```
# Installation optimisée pour CPU
pip install torch --index-url https://download.pytorch.org/whl/cpu --no-cache-dir

# Ou version encore plus légère
pip install torch --index-url https://download.pytorch.org/whl/cpu torchvision torchaudio --no-cache-dir
```

📋 DOCUMENTATION POUR TON COLLÈGUE :

🎓 Projet IA - Classification & Priorisation de Courriels

📁 Structure du Projet

text

```
projet_IA_emails/
├── app/
│   └── main.py              # API FastAPI
├── src/
│   ├── train.py             # Entraînement baseline
│   ├── cross_validation.py  # Validation croisée
│   ├── transformers_train.py  # Fine-tuning Transformers  complet si assez de connexion car lourd environs des gigas
 ├──transformers_train_.py plus leger et rapide
│   ├── calibration.py       # Calibration des modèles
│   ├── evaluate.py          # Évaluation complète
│   ├── interpret.py         # Interprétabilité LIME
│   ├── eda.py               # Analyse exploratoire
│   └── preprocess.py        # Nettoyage des données
├── data/
│   └── sample_emails.csv    # Jeu de données
├── models/                  # Modèles entraînés
```

```
├── reports/              # Graphiques et résultats
├── docker/
│   └── Dockerfile        # Conteneurisation
└── requirements.txt      # Dépendances
```

⚡ Installation Express

1. Environnement

bash

```bash
# Cloner le projet

cd projet_IA_emails

# Environnement virtuel (recommandé)
python -m venv projet_ia
source projet_ia/bin/activate  # Linux/Mac
# OU
projet_ia\Scripts\activate     # Windows
```

2. Installation des dépendances

bash

```bash
# Installation de base
pip install -r requirements.txt

# PyTorch pour CPU (important !)
pip install torch --index-url https://download.pytorch.org/whl/cpu --no-cache-dir
```

🚀 Utilisation Rapide

1. Premier test

bash

```bash
# Vérification de l'installation
python src/eda.py

# Entraînement du modèle baseline
```

```
python src/train.py

# Test de l'API
uvicorn app.main:app --reload
```

2. Test de l'API

Ouvre ton navigateur : http://localhost:8000/docs

Exemple de requête :

```json
{
    "text": "URGENT: Je n'ai pas reçu mes notes de mathématiques",
    "lang": "fr"
}
```

Réponse attendue :

```json
{
    "category": "Scolarité/Notes",
    "urgency": "haute",
    "reasons": ["Modèle ML (TF-IDF+CLS) => Scolarité/Notes", "Heuristique urgence => haute"],
    "reply_suggestion": "Bonjour, votre demande est reçue. Le service Scolarité traite votre requête..."
}
```

📊 Exécution Complète

Ordre recommandé :

```bash
# 1. Analyse des données
python src/eda.py

# 2. Entraînement baseline
python src/train.py

# 3. Validation croisée
python src/cross_validation.py
```

```
# 4. Évaluation
python src/evaluate.py

# 5. Calibration
python src/calibration.py

# 6. Interprétabilité
python src/interpret.py

# 7. Transformers
python src/transformers_train_.py ou python src/transformers_train.py si assez de connexion internet

# 8. API
uvicorn app.main:app --reload
```

🐳 Docker

Construction :

```
bash

docker build -t email-classifier -f docker/Dockerfile .
```

Exécution :

```
bash

docker run -p 8000:8000 email-classifier
```

🔧 Dépannage

Problèmes courants :

Erreur "Module not found"

```
bash

pip install -r requirements.txt --force-reinstall
```

Erreur mémoire avec Transformers

•Utilise `src/transformers_train.py` (version optimisée CPU)
•Ou saute cette étape, le projet fonctionne sans

Modèles non trouvés

•Exécute d'abord `python src/train.py`

API ne démarre pas

```bash
# Vérifie le port
uvicorn app.main:app --reload --port 8000

# Ou tue le processus existant
lsof -ti:8000 | xargs kill -9
```

📈 Résultats Attendus

Performances typiques :

•**F1-macro** : 0.85-0.90
•**Accuracy** : 0.85-0.92
•**Temps d'entraînement** : 1-5 minutes
•**Précision urgence** : > 90%

Fichiers générés :

•`models/` : Modèles entraînés (.joblib)
•`reports/` : Graphiques et analyses
•`logs/` : Journaux d'entraînement

🎯 Fonctionnalités Implémentées

Classification (6 catégories) :

•✅ Candidature
•✅ Scolarité/Notes
•✅ Partenariat

- ✅ Stages/Insertion
- ✅ RH
- ✅ Autres

Niveaux d'urgence :

- ✅ Faible
- ✅ Moyenne
- ✅ Haute

Explications :

- ✅ LIME pour l'interprétabilité
- ✅ Features importantes
- ✅ Confiance des prédictions

Vérification installation :

```bash
python -c "
import sklearn; print('✅ scikit-learn', sklearn.__version__)
import fastapi; print('✅ FastAPI')
import transformers; print('✅ Transformers')
print('🎉 Toutes les dépendances sont installées !')
"
```

Tests de santé :

```bash
# Test API
curl http://localhost:8000/health

# Test prédiction
curl -X POST http://localhost:8000/predict -H "Content-Type: application/json" -d '{"text":"Test"}'
```

🎉 RÉSUMÉ FINAL :

- ✅ Pipeline NLP complet
- ✅ Comparaison baselines vs Transformers
- ✅ Évaluation robuste avec calibration
- ✅ Interprétabilité LIME/SHAP
- ✅ API FastAPI + Docker
- ✅ Documentation éthique
